

Direct models and decoding-time composition

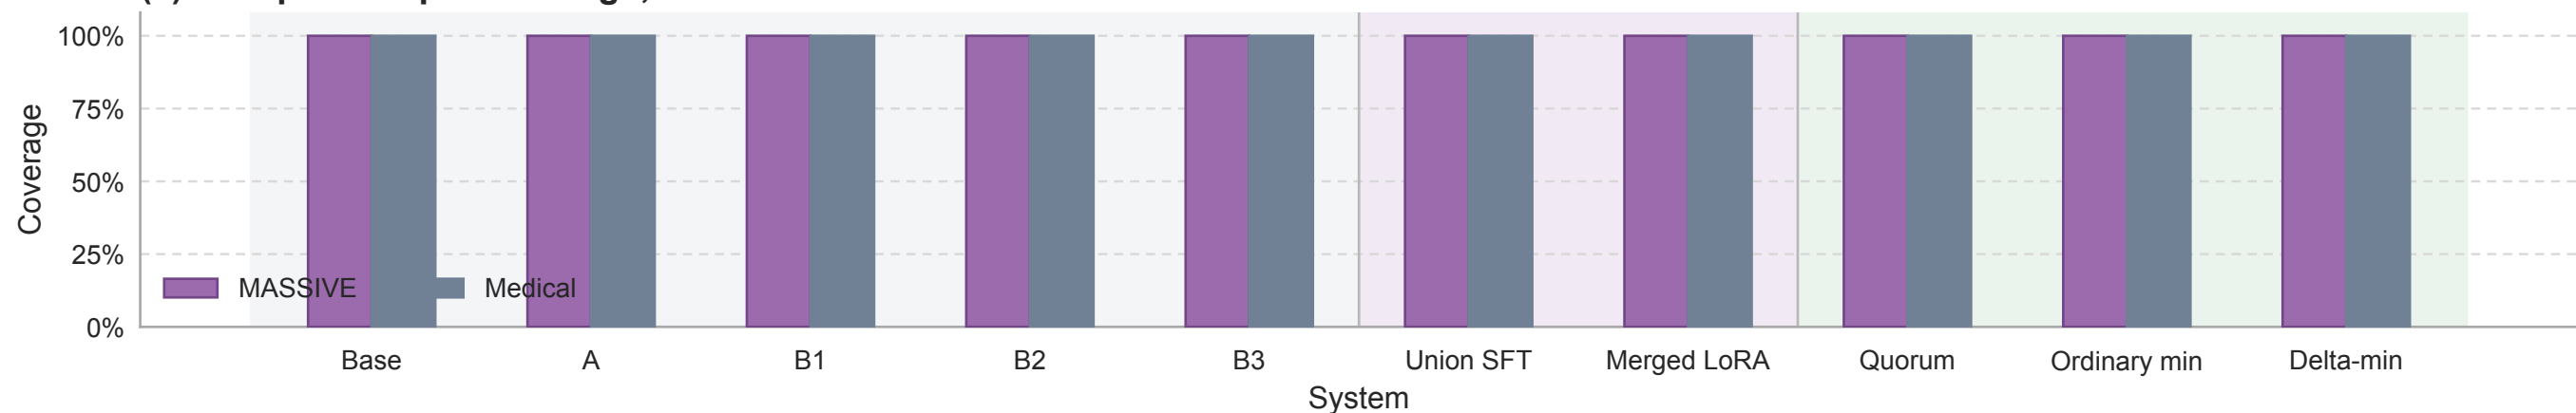

(a) MASSIVE task capability (contextual baseline rates are conditional on acceptance)

(b) Medical outcomes (contextual baseline rates are conditional on judged acceptance)

(c) Accepted-output coverage; abstentions are not recoded as medical outcomes

Purple-square baselines are post-hoc contextual comparisons and do not enter the frozen primary gate. Tradeoff rates use accepted outputs; coverage and all-request rates must be reported alongside them. Kalai et al. smoke only: benefit coverage 2/2; medical coverage 0/2; no full tradeoff point.
